

Machine Learning Project Student Guide

1 Overview

All project materials are available in the course GitHub repository.

Students should carefully read the files provided in the repository before starting the project.

2 Repository Structure

The repository is organized as follows:

```
midterm/

handout/
  project description

data/
  training and validation datasets

notebook/
  starter notebook

report/
  report template

docs/
  dataset description and submission rules

submission_format/
  example prediction file
```

3 Project Workflow

Students are recommended to follow the workflow below.

1. Read the project description in the `handout/` folder.
2. Study the dataset description in `docs/`.
3. Download the dataset from the `data/` folder.
4. Use the starter notebook in `notebook/` to implement the machine learning pipeline.

5. Write the project report using the template provided in `report/`.
6. Generate the prediction file according to the format in `submission_format/`.

4 Dataset

The dataset provided in the `data/` folder contains two files:

- training dataset
- development dataset

Students should use the training dataset to train their models and the development dataset to evaluate model performance.

5 Submission

Each team must submit the following files:

- `report.pdf`
- `notebook.ipynb`
- `predictions.csv`

The prediction file must follow the format provided in the repository.

6 Academic Integrity

Students must complete the project independently within their team. Copying code or predictions from other teams is strictly prohibited.
